

The tab doesn't fit in the slot!

Don't fret about slots that are too short and waste time opening them out, just make the corresponding tab smaller in length, fits every time.

Too narrow is a different matter and it's rather more complicated in the etch process.

If slots are too narrow, they can be opened with a loose piercing saw blade of matching size. The trick is to pull it through so that the teeth do not cut, but just rub through the slot. Twisting the blade carefully helps. If necessary, repeat with a larger size. This works nicely if the slots have a cusp that needs to be removed.
